

VR2W Underwater Upload Cable

A division of AMIRIX

Retrieve data from your VR2W acoustic receivers without bringing them to the surface

The **VR2W underwater upload cable** is a 30' long USB-Bluetooth™ underwater cable. As Bluetooth radio signals do not travel far underwater, this cable provides researchers with a method of retrieving data from VR2Ws without bringing the VR2W to the surface.

Simply plug the cable into the USB port of your computer, the same as you would with our USB Bluetooth device. Have a diver affix the opposite end of the cable by placing the probe in the activation hole of the VR2W. When the probe is inserted, the VR2W will be placed into Bluetooth mode (long flashes will be displayed

on the VR2W's LED) and the VR2W will be detected normally in VUE. Upload data using VUE as you normally would.

Note that the cable needs to be removed and reinserted to start communications a second time.
